TREATMENT EFFECTIVENESS

Rationale

UNIVARIATE & CROSS-SECTIONAL

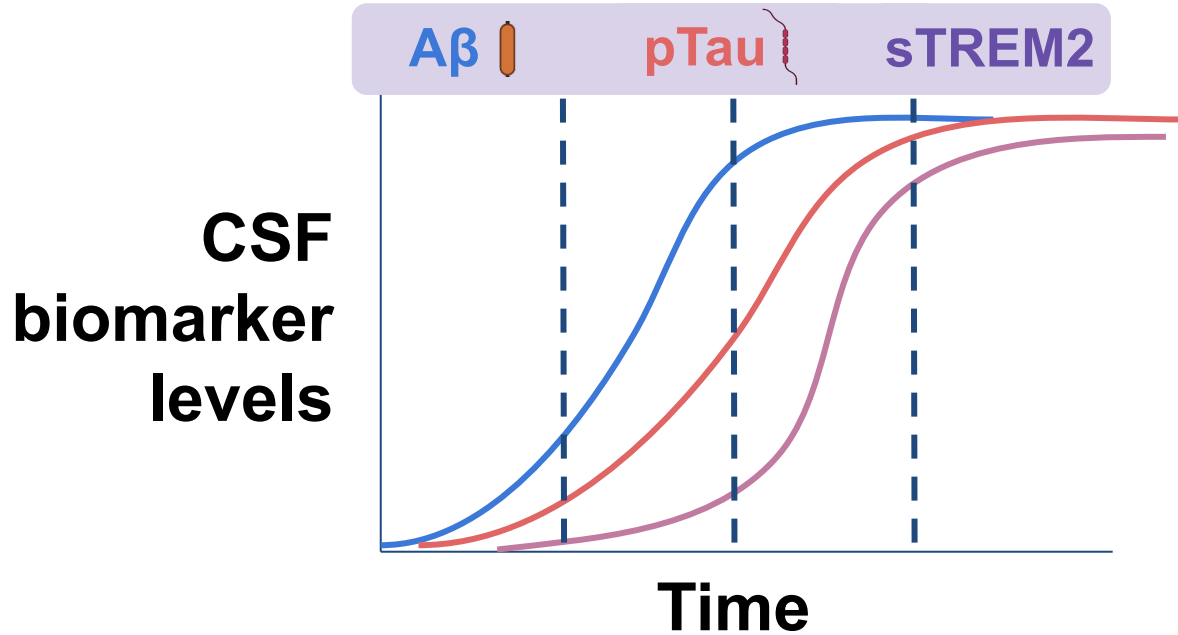

Rationale

Rationale

Rationale

MULTIVARIATE & LONGITUDINAL

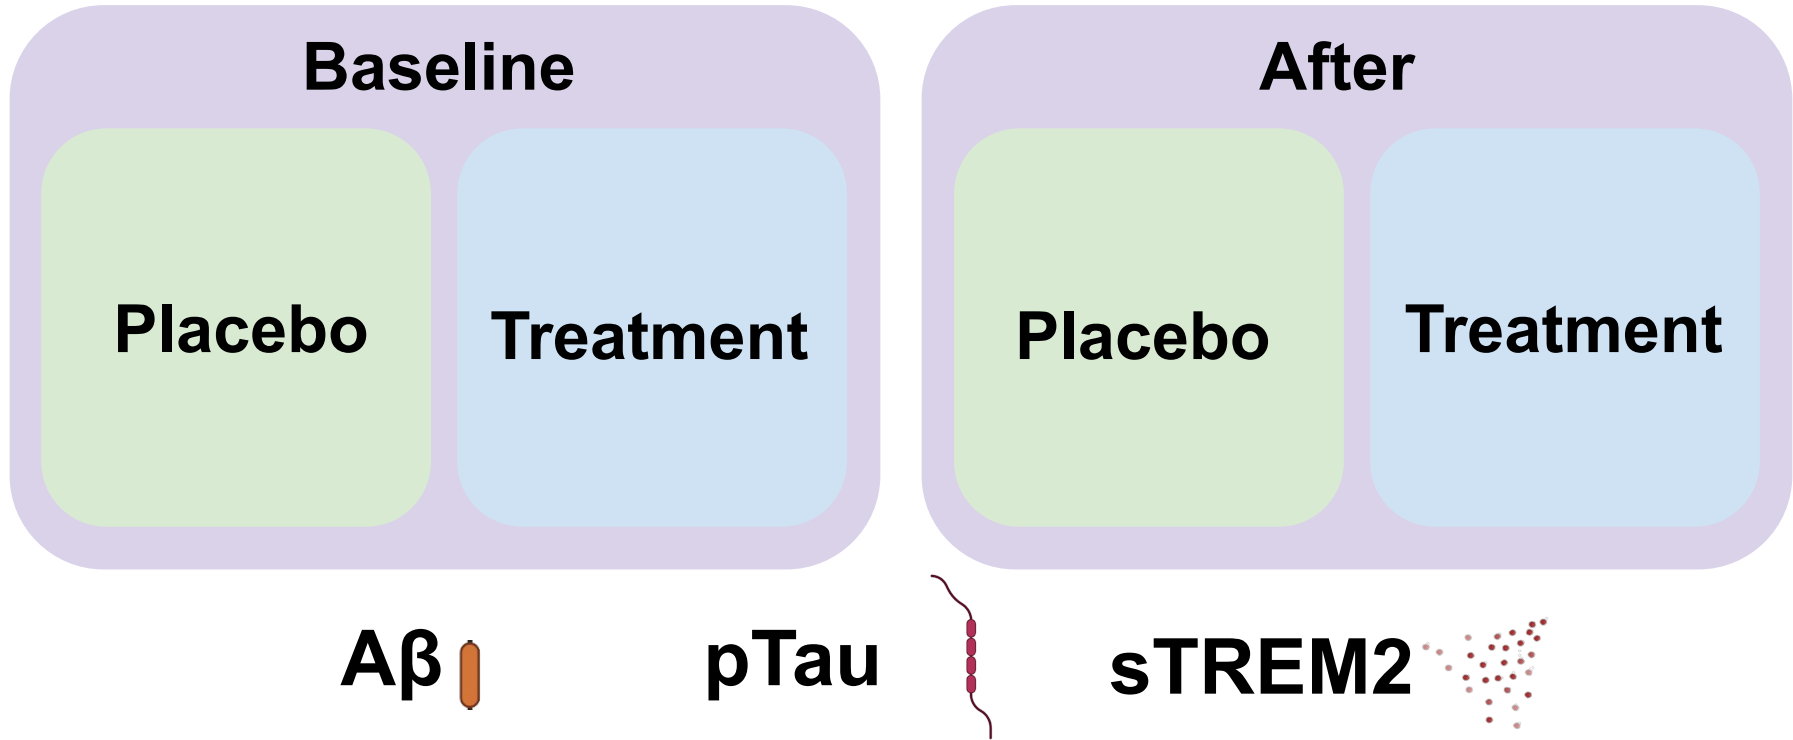

Hypothesis

Longitudinal multivariate analysis of CSF biomarkers will detect distinct phenotypes of biomarker interactions and trajectories associated with the treatment responder group in comparison to the treatment non-responder group.

LM11A-31 ●

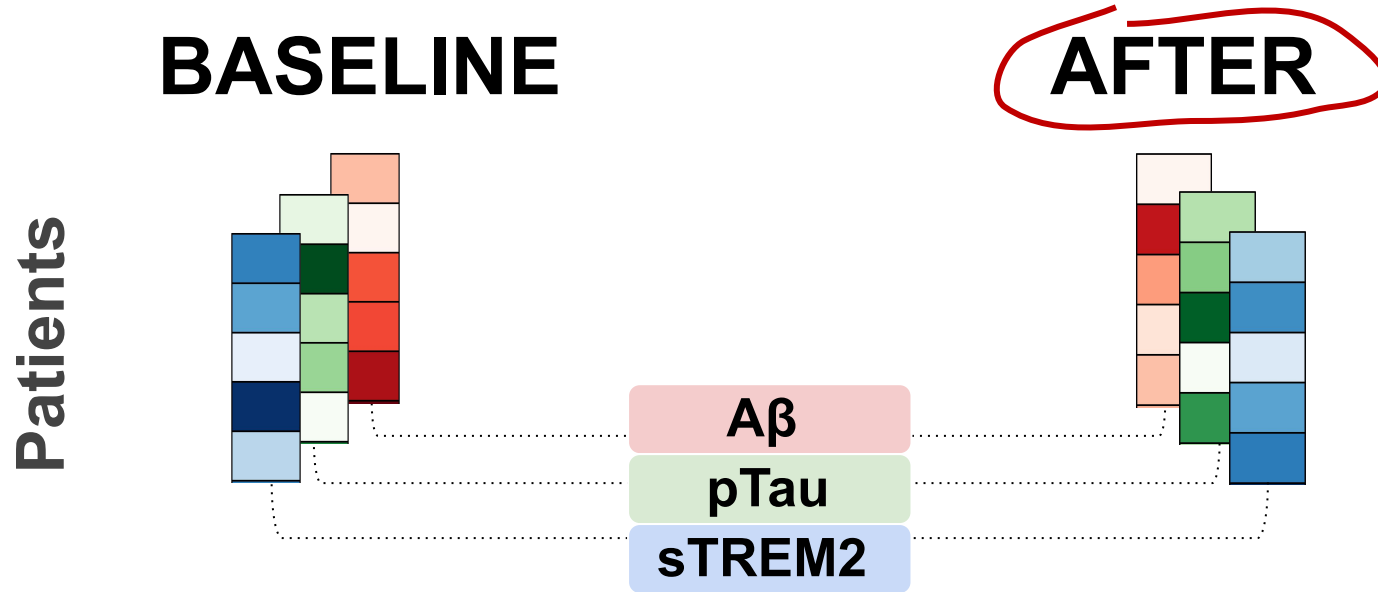

Methods

Clinical Trial Dataset n = 150

Similarity Network Fusion (SNF)

Step 1: Original Data

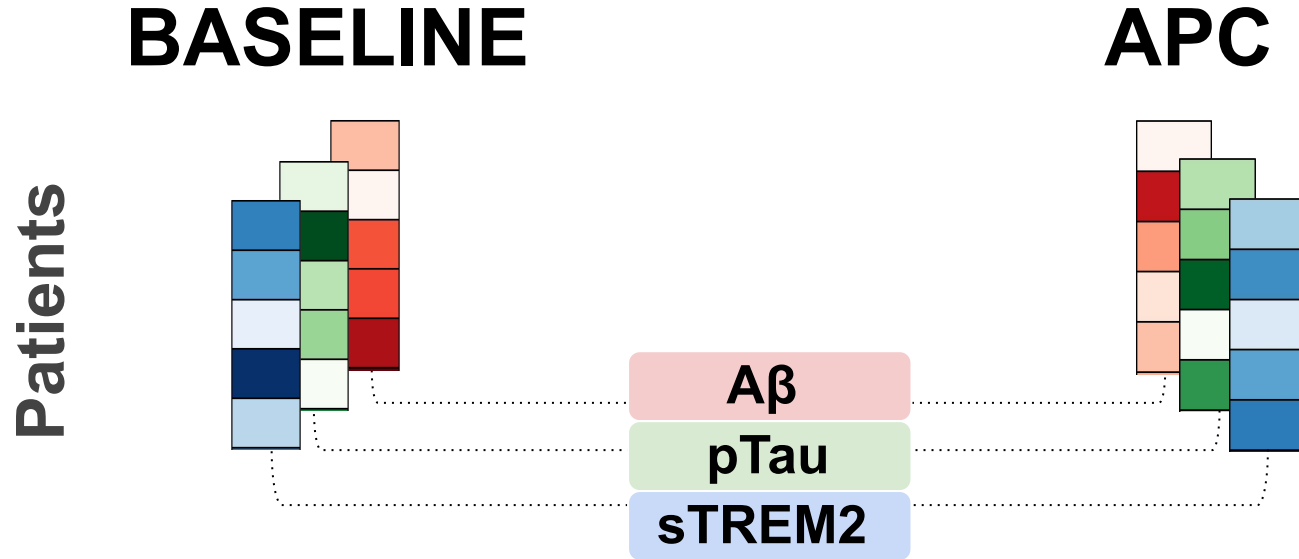

Similarity Network Fusion (SNF)

Step 1: Original Data

$$APC = \left[\left[\frac{\text{Time 2}}{\text{Time 1}} \right]^{\frac{365}{\text{Intervals}}} - 1 \right] \times 100$$

Similarity Network Fusion (SNF)

Step 1: Original Data

Similarity Network Fusion (SNF)

Step 2: Patient Similarity Matrices

Similarity Network Fusion (SNF)

Step 3: Patient Similarity Networks

BASELINE

Post-Hoc Analysis

Anticipated Results

Clustering

(Blennow, 2005,
Front. Neurosci)

A β

**No significant difference between
treatment response groups**

pTau

(Manucat-Tan et al., 2019, Aging)

**Significantly decreased
in response group**

sTREM2

**Significantly decreased
in response group**
